OVERLOAD PROTECTION - ELECTRICAL SPECIFICATION - STATUS

The overload occurs when the primary current I_p exceeds a trip level such that the fluxgate detector becomes completely saturated and, consequently, the transducer will switch from normal operation to overload mode. This trip level is guaranteed to be greater than 110 % of $I_{PN DC}$ and its actual value depends on operating conditions such as temperature and measuring resistance.

When this happens, the transducer will automatically begin to sweep in order to lock on the primary current again and the measuring can resume when the primary current returns in the nominal range between $-I_{PN DC}$ and $+I_{PN DC}$. In overload mode, the secondary current generated is a low frequency triangle waveform between - 0.4 A and 0.4 A.

Under these conditions:

- > The contact (normal operation status) between pin 3 and 8 (of the D-sub connector) switches off, this contact becomes open.
- > The green LED indicator (normal operation status) turns off.

Max voltage pin 3 and pin 8, off-State 100 V
Max current pin 3 and pin 8, on-State 1000 mA
On-State resistance pin 3 and pin 8: 50 m Ω (typ)

TO ENSURE A SAFE RECOVERY FROM SATURATION, THE MAXIMUM BURDEN RESISTOR ALLOWED IS 2.5 Ω .

CIRCUIT DIAGRAM FOR USING $R_M > 2.5 \Omega$

This circuit ensures a safe recovery from saturation when using $R_M > 2.5 \Omega$. It allows the transducer to recover normal operation in case R_M is greater than 2.5Ω and an overload is detected by the transducer.

CONTACT RL1 (PINS 3 & 8)	CONTACT RL2	V _{out}	DESCRIPTION
Closed	Open	Low (switches to GND)	The transducer is OK (Normal operation)
Open	Closed	High (switches to V+)	The transducer is not OK (Overload mode or supply fault)
