- 1) Voltage and current channel have a minimum input of 1 % range, otherwise individual uncertainty has to be calculated.
- 2) Add 0.03 % of range with no zero level.
- 3) When using the TRION-POWER-SUB-CUR-20A-1B sub-module: For self-generated heat caused by current input, add  $1.5 \times 10^{-4} \times I^2 \text{ %/A}^2$  of reading and additionally for DC only add  $10^{-4} \times I^2 \text{ %/A}^2$  of range to the active power accuracy. I is the current reading [A]. The influence from self-generated heat continues until the temperature of the shunt resistor inside the chassis lowers, even if the current input changes to a small value.

## Interchangeable sub-modules

### Available TRION-SUB modules

The TRION(3)-18xx-POWER-4 modules have 4 highly flexible voltage or current inputs. The 4 slots can be populated with four different direct current measurement modules or with three different D-SUB-9 modules to connect almost any kind of current transducer. Alternatively, this connector can also be used to measure any auxiliary  $\pm 10 \text{ V}$  signal (e.g. such as windspeed or water flow).

If more than 4 voltage inputs are required, the 4 slots can be also populated with our latest interchangeable voltage input sub-modules. Choose from a low-voltage, isolated 5 V or an isolated, 600 V CATII rated sub-module.
