

For the electronic measurement of current: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

## Features

- Closed loop (compensated) current transducer using an extremely accurate zero flux detector
- 9-pin D-Sub male secondary connector
- Status signal to indicate the transducer state
- LED indicator confirms normal operation
- Metal housing to improve immunity to EMC & power dissipation
- Operating temperature  $-40 \text{ }^{\circ}\text{C}$  to  $85 \text{ }^{\circ}\text{C}$ .

## Special feature

- Customer label dedicated to "Signaltec" (Product name: CT 500).

## Advantages

- Very high accuracy
- Excellent linearity
- Extremely low temperature drift
- Wide frequency bandwidth
- High immunity to external fields
- No insertion losses
- Very low noise on output signal
- Low noise feedback to primary conductor.

## Applications

- Feedback element in high performance gradient amplifiers for MRI
- Feedback element in high-precision, high-stability power supplies
- Calibration unit
- Energy measurement
- Medical equipment.

## Standards

- EN 61000-6-2: 2005
- EN 61000-6-3: 2007
- EN 61010-1: 2010.

## Application Domain

- Industrial
- Laboratory
- Medical.

**Insulation coordination**

Parameter	Symbol	Unit	Value	Comment
RMS voltage for AC insulation test, 50 Hz, 1 min	$U_d$	kV	4.2	Between primary and secondary + shield
Impulse withstand voltage 1.2/50 $\mu$ s	$U_{Ni}$	kV	8	
Clearance (pri. - sec.)	$d_{Cl}$	mm	11.5	Shortest distance through air
Creepage distance (pri. - sec.)	$d_{Cp}$	mm	11.9	Shortest path along device body
Comparative tracking index	$CTI$		600	
Rated insulation RMS voltage	$U_{Nm}$	V	1000	Basic insulation according to IEC 61010-1 CAT III, PD2
Rated insulation RMS voltage			1000	Reinforced insulation according to IEC 61010-1 CAT II, PD2

**Environmental and mechanical characteristics**

Parameter	Symbol	Unit	Min	Typ	Max	Comment
Ambient operating temperature	$T_A$	$^{\circ}$ C	-40		85	
Ambient storage temperature	$T_{Ast}$	$^{\circ}$ C	-40		85	
Relative humidity	$RH$	%	20		80	
Dimensions						See drawing on page 9
Mass	$m$	kg		1.15		

**Electrical data**

At  $T_A = 25\text{ °C}$ ,  $\pm U_C = \pm 15\text{ V DC}$ , unless otherwise noted.

Lines with a \* in the comment column apply over the  $-40 \dots 85\text{ °C}$  ambient temperature range.

Parameter	Symbol	Unit	Min	Typ	Max	Comment
Primary nominal DC current (continuous)	$I_{PNDC}$	A	-500		500	*
Primary nominal AC RMS current (continuous)	$I_{PNAC}$	A			500	*
Primary current, measuring range	$I_{PM}$	A	-800		800	*
Measuring resistance	$R_M$	$\Omega$	0		2.5	See graph on page 5 for other values
Secondary nominal RMS current	$I_{SN}$	A	-0.666		0.666	*
Number of secondary turns	$N_S$			750		
Resistance of secondary winding	$R_S$	$\Omega$		6.5		
Maximum withstand primary peak current <sup>1)</sup>	$\hat{I}_{Pmax}$	kA	-5		5	@ pulse of 100 ms
Supply voltage DC	$+U_C$	V	14.25	15	15.75	
	$-U_C$		-14.25	-15	-15.75	
Current consumption positive DC	$+I_C$	A		0.12		@ $I_P = 0$
					1.19	@ $I_{PM} = 800\text{ A}$
Current consumption negative DC	$-I_C$	A		0.07		@ $I_P = 0$
					1.14	@ $I_{PM} = -800\text{ A}$
RMS noise current 0 ... 10 Hz <sup>2)</sup>	$I_{no}$	ppm		0.05	0.1	
RMS noise current 0 ... 10 kHz <sup>2)</sup>				1.5	4	
RMS noise current 0 ... 160 kHz <sup>2)</sup>				3.5	10	
Output peak-to-peak noise current <sup>2)</sup>	$I_{no pp}$	ppm		18	34	
Electrical offset current + self magnetization + effect of earth magnetic field <sup>2)</sup>	$I_{OE}$	ppm	-10	-3	10	
Temperature coefficient of $I_{OE}$ @ $I_P = 0\text{ A}$	$TCI_{OE}$	ppm/K	-0.2	0.05	0.2	
Linearity error <sup>2)</sup>	$\varepsilon_L$	ppm	-1.5	0.8	1.5	
			-3	1	3	*
Delay time to 90 % of the final output value for $I_{PNDC}$ step	$t_{D90}$	$\mu\text{s}$			1	$di/dt$ of 100 A/ $\mu\text{s}$
Frequency bandwidth ( $\pm 1\text{ dB}$ )	$BW$	kHz		400		Small-signal bandwidth, 1.5 % of $I_{PN}$
Frequency bandwidth ( $\pm 3\text{ dB}$ )	$BW$	kHz		520		
Start-up time	$t_{start}$	s			15	

**Notes:** <sup>1)</sup> Single pulse only, not AC. The transducer may require a few seconds to return to normal operation when autoreset system is running

<sup>2)</sup> All ppm figures refer to full-scale which corresponds to a secondary nominal RMS current.

### Overload protection - Electrical specification - Status

The overload occurs when the primary current  $I_p$  exceeds a trip level such that the fluxgate detector becomes completely saturated and, consequently, the transducer will switch from normal operation to overload mode.

This trip level is guaranteed to be greater than  $I_{PM}$  and its actual value depends on operating conditions such as temperature and measuring resistance.

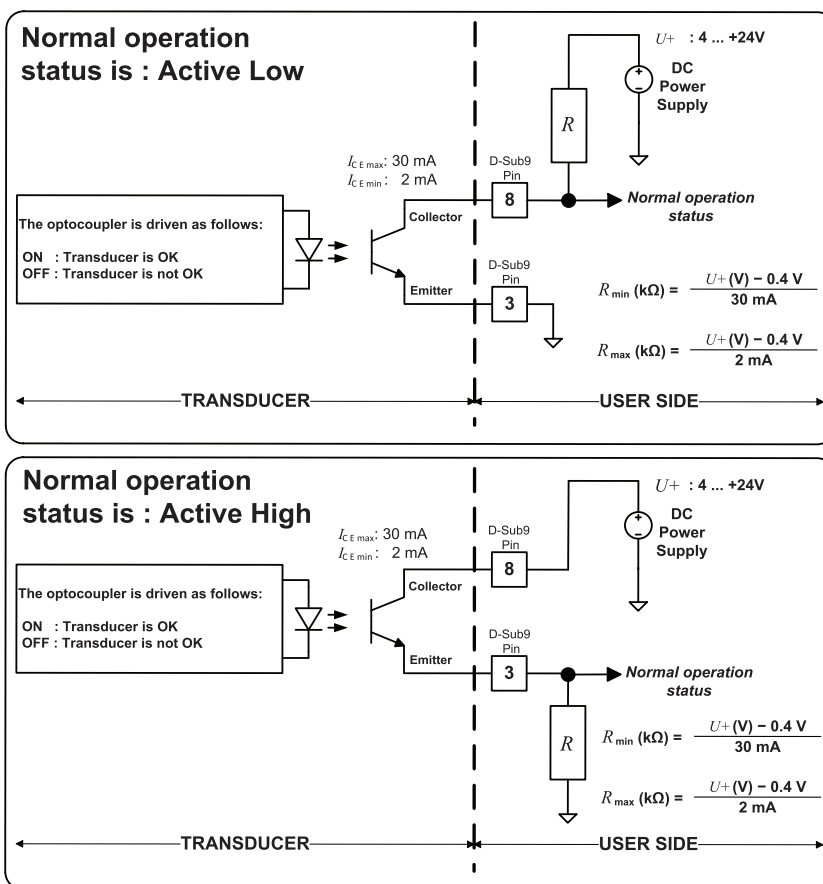

When this happens, the transducer will automatically begin to sweep in order to lock on the primary current again.

The overload conditions will be:

- The secondary current  $I_s$  generated is a low frequency signal.
- The signal normal operation status (between pin 3 and 8 of the D-Sub connector) switches to  $U+$  or  $\approx 0.7 V$ . See the status port wiring below.
- The green LED indicator (normal operation status) turns off.

The measuring can resume when the primary current returns in the measuring range between  $-I_{PN}$  and  $+I_{PN}$ . Then the signal normal operation status switches to GND and the green LED indicator (normal operation status) switches on.

### Status/Interlock port wiring

The following table shows how the normal operation status acts as below:

Status	Value	Description
Active Low	$\approx 0.7\ V$	The transducer is OK (Normal operation)
	$U+$	The transducer is not OK (Overload mode or supply fault)
Active High	$U+$	The transducer is OK (Normal operation)
	$\approx 0.7\ V$	The transducer is not OK (Overload mode or supply fault)

Maximum measuring resistance versus primary current and temperature

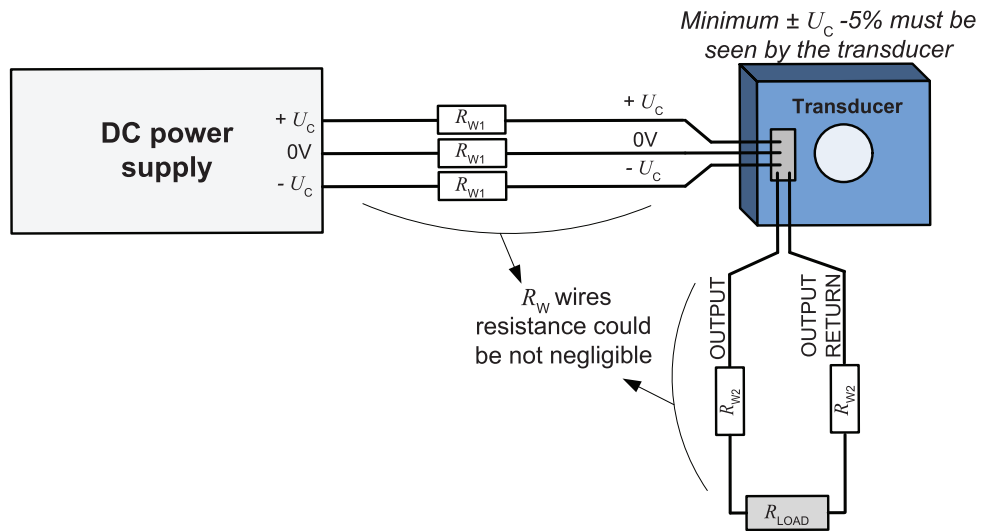

$\pm U_C = \pm 14.25 \text{ V}$

**Power supply and load**

In order to reach the measuring range according to the maximum measuring resistor, be careful with the setup measurement when the wires lengths are long. This means:

- the wire resistance is not negligible
- the voltage at the output of the DC power supply and the voltage at the transducer could be significantly different.

$R_w$  wire resistance in  $\Omega$  is:

$$R_w = \rho \frac{l}{S}$$

- S: Cross section of wire in  $m^2$
- $l$ : Wire length in m
- $\rho$ : Resistivity of material in  $\Omega.m$

**Total measuring resistance is:**

$$R_M = R_L + 2 \times R_{w1} + 2 \times R_{w2}$$

If  $R_{w1} = R_{w2} = R_{WIRE}$  then  $R_M = R_L + 4 \times R_{WIRE}$

## Performance parameters definition

The schematic used to measure all electrical parameters is shown below:

### Transducer simplified model

The static model of the transducer at temperature  $T_A$  is:

$$I_S = N_P/N_S \cdot I_P + \varepsilon$$

In which

$$\varepsilon = I_{OE} \text{ at } 25^\circ\text{C} + I_{OT}(T_A) + \varepsilon_L \cdot I_{PM} \cdot N_P/N_S$$

Where,

$$I_{OT}(T_A) = TCI_{OE} \cdot |T_A - 25^\circ\text{C}| \cdot I_{PM} \cdot N_P/N_S$$

- $I_S$  : secondary current (A)
- $N_P/N_S$  : turns ratio (1:  $N_S$ )
- $I_P$  : primary current (A)
- $I_{PM}$  : primary current, measuring range (A)
- $T_A$  : ambient operating temperature ( $^\circ\text{C}$ )
- $I_{OE}$  : electrical offset current (A)
- $I_{OT}$  : temperature variation of  $I_{OE}$  at  $T_A$  (A)
- $\varepsilon_L$  : linearity error

This is the absolute maximum error. As all errors are independent, a more realistic way to calculate the error would be to use the following formula:

$$\varepsilon = \sqrt{\sum_{i=1}^N \varepsilon_i^2}$$

### Linearity

To measure linearity, the primary current (DC) is cycled from 0 to  $I_{PM}$ , then to  $-I_{PM}$  and back to 0. The linearity error  $\varepsilon_L$  is the maximum positive or negative difference between the measured points and the linear regression line, expressed in parts per million (ppm) of full-scale which corresponds to the maximum measured value.

### Electrical offset

The electrical offset current  $I_{OE}$  is the residual output current when the input current is zero.

The temperature variation  $I_{OT}$  of the electrical offset current  $I_{OE}$  is the variation of the electrical offset from  $25^\circ\text{C}$  to the considered temperature.

### Delay times

The delay time  $t_{D,10}$  @ 10% and the delay time  $t_{D,90}$  @ 90% with respect to the primary are shown in the next figure.

Both slightly depend on the primary current  $di/dt$ . They are measured at nominal current.

## Safety

This transducer must be used in limited-energy secondary circuits according to IEC 61010-1.

This transducer must be used in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating instructions.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (e.g. primary busbar, power supply). Ignoring this warning can lead to injury and/or cause serious damage.

This transducer is a built-in device, whose conducting parts must be inaccessible after installation.

A protective housing or additional shield could be used. Main supply must be able to be disconnected.

**Dimensions (in mm)**

**Connection**

- Normal operation status (Pins 3 and 8)  
Normal operation means:
  - $\pm 15\text{ V}$  ( $\pm U_C$ ) present
  - 0 V on D-Sub has to be tied
  - zero detector is working
  - compensation current  $\leq I_{PM}$  DC
  - green LED indicator switches on.

**Mechanical characteristics**

- General tolerance  $\pm 0.5\text{ mm}$
- Transducer fastening
  - Horizontal mounting  $4\text{ slotted holes } \phi 5.5\text{ mm}$   
 $4\text{ M5 steel screws}$
  - Recommended fastening torque  $3.7\text{ N}\cdot\text{m}$
  - Vertical mounting  $2\text{ slotted holes } \phi 6.5\text{ mm}$   
 $2\text{ M6 steel screws}$
  - Recommended fastening torque  $4.4\text{ N}\cdot\text{m}$
- Connection of secondary on D-Sub-9, UNC 4-40 connector

**Remarks**

- $I_s$  is positive when  $I_p$  flows in the direction of the arrow.
- We recommend that a shielded output cable and plug are used to ensure the maximum immunity against electrostatic fields.
- Temperature of the primary conductor should not exceed  $100\text{ }^\circ\text{C}$ .
- We recommend to fix the potential of the housing to the ground or 0 V (on indicated surfaces).
- Installation of the transducer must be done unless otherwise specified on the datasheet, according to LEM Transducer Generic Mounting Rules. Please refer to LEM document N°ANE120504 available on our Web site: <https://www.lem.com/en/file/3137/download>.
- All mounting recommendations are given for a standard mounting. Screws with flat and spring washers.
